

Transparency guidelines for third-party resources (materials/data/analysis scripts)

Box 1. Summary

- By default, Psychological Science [requires](#) authors to make all research materials, raw/primary data, and analysis scripts publicly available in [a trusted repository](#), unless there are reasonable constraints.
- When data or materials are managed by a third-party, this can complicate authors' ability to fully comply with the journal's policies.
- Authors should aim to be as transparent as possible, guided by the maxim “as open as possible, as closed as necessary”.
- This guidance document provides a practical workflow to help authors navigate situations involving third-party data or materials.
- This guidance document is intended to be pragmatic and advisory only; the journal reserves the right to use case-by-case editorial discretion to determine whether constraints on transparency are allowed.

What are third-party data or materials?

Third-party data or materials refers to data or materials that are managed by individuals/organisations other than the authors. For example, secondary analysis of a dataset collected as part of a longitudinal study (reported elsewhere) or use of a survey instrument created and validated in a separate study (reported elsewhere).

Maximising the transparency of third-party data or materials

Authors should aim to make their research “as open as possible and as closed as necessary”. In practice, this means attempting to comply with the journal's

default transparency policies as far as possible, while ensuring that sharing is legal and responsible. Authors should consider seeking permission to reshare any third-party data or materials alongside the present research, thus enabling them to comply with the journal's default policies. If this is not possible or appropriate, authors should complete the forms below for each individual source of data/materials (Table 1 and Table 2). These forms can be shared in a [trusted repository](#) and linked to from the manuscript's Research Transparency Statement.

Table 1. Transparency form for third-party data.

Name and/or source of data	
Name of individual(s) / organisation that controls the data	
Name of author(s) who obtained the data from the third party	
If relevant, provide a citation to the data here and in the manuscript.	
Is access to the data... • public • restricted • data are not available • other (please expand)	
If the data are not publicly available, please explain why not. Please provide documentation of the transparency constraint where possible (e.g., copies of data access agreements)*.	
Provide clear step-by-step instructions explaining how the data were obtained / how an	

independent researcher could access the data. Ensure that you provide sufficient detail about accessing the *specific data used in the present study*.	
Are the data stored in a location that qualifies as a trusted repository?	
Please link to documentation that describes the data (e.g., data dictionary or codebook).	
If there are materials relevant to acquisition of this data (e.g., survey instruments) please link to them. Please also link to documentation that describes the materials.	
Other information about these data.	

*Ideally link to publicly available documentation. Private documentation can be shared with the journal's STAR Team (psych.star.team@gmail.com).

Table 2. Transparency form for third-party materials.

Name and/or source of materials	Professor Daphne Maurer
Name of individual(s) / organisation that controls the materials	Professor Daphne Maurer McMaster University Canada
Name of author(s) who obtained the materials from the third party	Zahra Hussain
If relevant, provide a citation to the materials here and in the manuscript.	Le Grand R, Mondloch CJ, Maurer D, Brent HP. 2004. Psych. Sci., 15(11), 762-8.

Is access to the materials... • public • restricted • materials are not available • other (please expand)	Restricted. The images are available on request from the corresponding author of this article (Hussain), who will seek permission from the original source before distributing.
If the materials are not publicly available, please explain why not. Please provide documentation where possible (e.g., copies of access agreements)*.	The images are of individuals who did not consent to public sharing at the time the photographs were made.
Provide clear step-by-step instructions explaining how the materials were obtained / how an independent researcher could access the materials. Ensure that you provide sufficient detail about accessing the *specific materials used in the present study*.	The original face images were modified to create the chimeric faces as described in the manuscript. The full modified (chimeric) face set is available on request from Dr Hussain. A subset of freely available faces is available on OSF.
Are the materials stored in a location that qualifies as a trusted repository?	No, but a subset of stimuli derived from a different source is stored on OSF.
Please link to documentation that describes the materials.	https://osf.io/umjhr/overview
Other information about these materials.	

*Ideally link to publicly available documentation. Private documentation can be shared with the journal's STAR Team (psych.star.team@gmail.com).
